WEIGHTS

Fawn F	3.8
Pink F	3.8
Grizzle F	3.12
Yellow F	3.6
Green M	3.6
Blue M	3.6
Red M	3.12

Look how quickly the brain develops between the time the pup is 1 day old until he is an adult!

Example #4 on the top is at 3 weeks!

Coming Alive!

This is the week we look forward to from the time the puppies are born! They now will begin to interact with one another and will discover 'toys.' Their eyes and ears have opened sufficiently that they can see and hear although not as well as they will be able to in another week. Their teeth begin to erupt causing their mama to retreat from the whelping box. Although their tails are pretty short, we will begin to see them wag and the pups will now bark rather than squeak. Even at this

very young age we will begin to see subtle personality traits beginning to develop, especially at the food dish. Although they'll still sleep 90% of the time, when they're awake they are aware of our presence and surroundings. We have soft toys in their play area which they will mouth and gum; we'll also continue to expose them to various surfaces for walking (rugs, rubber, wood, plastic.)

We will likely have just started them on solid

(mushy) food by the time they are 3 weeks old; especially with a large litter. The first meals are food from our farm—raw ground lamb, chevre, eggs ~ these are all highly palatable foods for a baby's digestive system.

The Mama Dog

This week starts the next chapter for the mother dog. With the eruption of teeth in her puppies, she'll leave them more often but will also be producing more milk. It can be a

challenge to keep a mother dog in good weight. We will often feed free-choice and supplement with raw chicken backs and lamb. As the pups eat more solid food. She

will stop cleaning the whelping area; a task that I, unfortunately, must now take on!

Clean towels!!

Dealing With Dominance In Dogs

What does “dominance” mean?

In order to understand why your dog is acting “dominant,” it's important to know some things about canine social systems. Animals who live in social groups, including domestic dogs and wolves, establish a social structure called a dominance hierarchy within their group. This hierarchy serves to maintain order, reduce conflict and promote cooperation among group members. A position within the dominance hierarchy is established by each member of the group, based on the outcomes of interactions between themselves and the other pack members. The more dominant animals can control access to valued items such as food, den sites and mates. For domestic dogs, valued items might be food, toys, sleeping or resting places, as well as attention from their owner.

In order for your home to be a safe and happy place for pets and people, it's best that the humans in the household assume the highest positions in the dominance hierarchy. Most dogs assume a neutral or submissive role toward people, but some dogs will challenge their owners for dominance.

A dominant dog may stare, bark, growl, snap or even bite when you give him a command or ask him to give up a toy, treat or resting place. Sometimes even hugging, petting or grooming can be interpreted as gestures of dominance and, therefore, provoke a growl or snap because of the similarity of these actions to behaviors that are displayed by dominant dogs. Nevertheless, a dominant dog may still be very affectionate and may even solicit petting and attention from you.

You may have a dominance issue with your dog if:

He resists obeying commands that he knows well.

He won't move out of your way when required.

He nudges your hand, takes your arm in his mouth or insists on being petted or played with (in other words, ordering you to obey him).

He defends his food bowl, toys or other objects from you.

He growls or bares his teeth at you under any circumstances.

He won't let anyone (you, the vet, the groomer) give him medication or handle him.

He gets up on furniture without permission and won't get down.

He snaps at you.

What to do if you recognize signs of dominance in your dog:

If you recognize the beginning signs of dominance aggression in your dog, you should immediately consult an animal behavior specialist. No physical punishment should be used. Getting physical with a dominant dog may cause the dog to intensify his aggression, posing the risk of injury to you. With a dog that has shown signs of dominance aggression, you should always take precautions to ensure the safety of your family and others who may encounter your dog by:

Avoiding situations that elicit the aggressive behavior.

During the times your dog is acting aggressively, back off and use “happy talk” to relieve the tenseness of the situation.

Supervise, confine and/or restrict your dog's activities as necessary, especially when children or other pets are present.

When you're outdoors with your dog, use a “Gentle Leader” or muzzle.

When you're indoors with your dog, control access to the entire house by using baby gates and/or by crating your dog. You can also use a cage-type muzzle, or a “Gentle Leader” and leash, but only when you can closely supervise your dog.

Dominance aggression problems are unlikely to go away without your taking steps to resolve them.

Treatment of dominance aggression problems should always be supervised by an animal behavior specialist since dominant aggressive dogs can be potentially dangerous.

The following techniques, which don't require a physical confrontation with your dog, can help you gain some control:

"Nothing in Life is Free" is a safe, non-confrontational way to establish your leadership and requires your dog to work for everything he gets from you.

Have your dog obey at least one command (such as "sit") before you pet him, give him dinner, put on his leash or throw a toy for him. If your dog doesn't know any commands or doesn't perform them reliably, you'll first have to teach him, using positive reinforcement, and practice with him daily. You may need to seek professional help if your dog is not obeying each time you ask after two to three weeks of working on a command.

Don't feed your dog people food from the table and don't allow begging.

Don't play "tug of war," wrestle or play roughly with your dog.

Ignore barking and jumping up.

Don't allow your dog on the furniture or your bed, as this is a privilege reserved for leaders. If your dog growls or snaps when you try to remove him from the furniture, use a treat to lure him off.

Otherwise, try to limit his access to your bed and/or furniture by using baby gates, a crate, or by closing doors.

Always remember to reward good behavior.

Consult your veterinarian about acupuncture, massage therapy or drug therapy.

Obedience classes may be helpful in establishing a relationship between you and your dog in which you give commands and he obeys them (be sure to choose a trainer who uses positive reinforcement methods). Obedience classes alone, however, won't necessarily prevent or reduce dominance aggression.

A Note About Children and Dogs

From your dog's point of view, children, too, have a place in the dominance hierarchy. Because children

are smaller and get down on the dog's level to play, dogs often consider them to be playmates, rather

than superiors. Small children and dogs should not be left alone together without adult supervision.

Older children should be taught how to play and interact appropriately and safely with dogs; however, no child should be left alone with a dog who has displayed signs of aggression.

Finally, if you believe your Bouvier is exhibiting signs of aggression as a youngster, please contact us! Young Bouviers from working lines often test the limits between the ages of 10 months and 2 years of age. Help your young partner prepare for this time by extensively socializing him as a little guy!
